PROJECTS

- **C++ to Node.js Authorization Service Rewrite** (Trellix, 2025–2026). Rewrote a legacy C++ authorization service in Node.js/Express by creating a Claude Code skill, delivering it end-to-end in ~2 months vs a projected multi-year rewrite (~90% time saved). Reviewed the full flow and fixed the niche logic the AI missed. *Node.js, Express, AI-assisted engineering*
- **OAuth Implicit to Authorization Code + PKCE Migration** (Trellix, 2023–2024). Core engineer in platform-wide migration to Authorization Code Flow w/ PKCE. Now the default auth flow for 110k+ daily authentications. Cut sign-in load ~20% by removing a blocking /scopes fetch gating login form, moving scope resolution to a cached backend AuthZ service. *Node.js, OAuth 2.0, Keycloak, JavaScript*
- **SAML IdP Delegation Service** (Trellix, 2026). Built a reusable SAML IdP service (IAM token to signed SAML assertion, a signing-cert /metadata API for SP verification) that unblocked the sale of Trellix's Mobile Threat Defense product, which couldn't ship without SAML support. Any SAML-only product now onboards without custom work. *Node.js, AWS Lambda, Secrets Manager, SAML 2.0*
- **Client Credentials Management Dashboard** (Trellix, 2022–2023). OAuth 2.0 machine-to-machine credential system - backend Lambda APIs for self-service client management, with scopes gated to each tenant's licenses. Replaced a ticket process where our team hand-minted every client, cutting manual client-creation requests to zero. *Node.js, AWS Lambda, Keycloak, RDS, Angular*

EMPLOYMENT

Software Engineer | Trellix (formerly McAfee) | Sep. 2021 – Present

- Engineer on the Trellix IAM platform serving every Trellix product, handling 110k+ daily auths across commercial AWS and GovCloud. Node.js/Java backend, Angular user administration UI, browser SDK. E2E RBAC platform.
- AI engineering: built Claude Code skills that automate our service upgrades end to end (2 hrs to 5 min), update docs, create Jiras for deployment, etc. Also created AI-driven security reviews that caught real production vulnerabilities.
- Owned IAM GovCloud end to end: features, compliance, incident response, image deployment coordination into FedRAMP High, DoD IL5.
- Built rate-limit infrastructure for our identity backend, unblocking our FedRAMP production deployment.
- Manage EKS clusters running entire FedRAMP IAM solution: Helm deployments, upgrades, and Kubernetes Secrets. Sole Keycloak maintainer (3+ yrs), with 10+ zero-downtime upgrades (KC 21 to 26.x) across plugins, client deps, and JS browser SDK.
- Remediated 60+ CVE findings (Wiz, BlackDuck, Invicti). Hardened container images (Iron Bank, RapidFort, Chainguard). Upgraded BouncyCastle FIPS libs for FIPS 140-3 compliance.
- Contributed FIPS 140-2 support at JVM level to RedHat maintainers of Keycloak solution with BouncyCastle Java FIPS deps. Cited in release notes.

Software Engineer, Intern | Vacasa | Jun. 2021 – Aug. 2021

- Hardened AWS EC2 instances per Tavora penetration-test findings; fixed front-end UI defects.

Software Engineer, Intern | McAfee | Mar. 2020 – Sep. 2020

- Built Concourse CI pipelines with metadata consolidation into an emailed report; wrote a net-new JUnit test framework for untested AWS Lambdas, reaching 100% coverage and enabling the team to write its own tests.

TECHNOLOGIES

- **Languages & Tools:** JavaScript, TypeScript, Java, Python 3, C/C++, Bash, SQL, Node.js, Angular, Express, JUnit, Cypress, Git, Helm
- **Cloud & DevOps:** AWS (Lambda, API Gateway, WAF, CloudFormation, DynamoDB, RDS, EC2, EKS, S3), AWS GovCloud, Docker, Kubernetes, Terraform, Jenkins, CI/CD
- **Identity & Security:** Keycloak, Okta, OAuth 2.0 (Auth Code + PKCE / Client Credentials / Implicit), SAML 2.0, OIDC, FIPS 140-2 & 140-3, FedRAMP (Moderate / High), DoD IL5, NIST 800-53

EDUCATION

Oregon State University

B.S. Computer Science, Systems | GPA: 3.50 (Cum Laude) | 2017–2021
